Patent No. 6280989

GENERAL INFORMATION:

APPLICANT: Kapitonov, Dmitri

APPLICANT: Yu, Robert

TITLE OF INVENTION: NOVEL SIALYLTRANSFERASES

FILE REFERNCE: VCUIP-6

CURRENT APPLICATION NUMBER: US/09/334,601

CURRENT FILING DATE: 1999-06-17

NUMBER OF SEQ ID NOS: 94

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 4

LENGTH: 414

TYPE: PRT

ORGANISM: Murinae gen. sp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cc specification describes a non-haemolytic cytolytic agent, which is a competition of control of the petitide copolymer. The agent has a selective cytolytic agent, which is a competitide copolymer. The agent has a selective cytolytic activity on competitive chairs and competitive chairs and comprises used to comprise and/or. The agent is selected from a cyclic derivative of a competitive which has a net positive charge greater than 1, comprises used has a net comprises I comprises used for cyclic derivative of a comprise and/or a peptide (or cyclic derivative of this) which chart comprises I camino acid residues and comprises an alpha-helix comprises I camino acid residues and D camino acid residues, has a net comprise I camino acid sequence such that comprises I camino acid sequence comprising only I camino acid residues are corresponding amino acid sequence comprising only I camino acid residues concerved found in nature. The cytolytic agents may be used for treatment of concerve of the cytolytic agents may be used for treatment of the cytolytic agents may be used for treatment of the cytolytic agents may be used for treatment of concerve of the cytolytic agents may be used for treatment of the cytolytic agents may be used for treatment of concerve of the cytolytic agents may be used for treatment of the cytolytic agents may be used for treatment of concerve of the cytolytic agents may be used for treatment of the cytolytic agents may be used for treatment of cytolyt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The present peptide is used to produce the agents of the invention. The specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises I-amino acid residues and/or D-amino acid residues and comprises an alpha-helix breaker moiety, or a peptide (or cyclic derivative of this) which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amin acid residues and/or D-amino acid residues and comprises an alpha-helix breaker moiety, or a peptide (or cyclic derivative of this) which (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that

The cytolytic agents may be used for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.
specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of several diseases caused by pathogens,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New non-haemolytic cytolytic agent useful in treating cancer infections - is a peptide comprising a moiety which disrupts continuity of an alpha-helical structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oren

They rused as disinfectants for destruction of microorganisms, i.e. solutions for wetting contact lenses, as preservatives, e.g., cosmetic and food industries, as pesticides (e.g. fungicides of the companion of the comp
This sequence represents a diastereomer peptide of the invention. This sequence is used in a "bundle sequence", which is created by binding copies of this sequence to peptide 23 (see AAW35149). The peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogand malignant cells not naturally present in the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse pathogens. The

Best Local 9
The present invention describes composition of matter (I) comprising of comain, pharmacologically active peptides, and linkers. Where (I) (X1)a-F1-(X2)b, where: F1 = an Fc domain, X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, (L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (L2)d-P2-(L3)e-P3-(L4)f-P4 (L2)d-P2-(L3)e-P3-(L4)f-P4 (L2)d-P2-(L3)e-P3-(L4)f-P4 (L2)d-P3-(L4)f-P4 (L2)d-P3-(L4)f-P4 (L2)d-P3-(L4)f-P4 (L3)d-P3-(L4)f-P4 (L3)d-P3-(L4)f-P4 (L3)d-P3-(L4)f-P4 (L4)d-P3-(L4)d-P3-(L4)f-P4 (L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)d-P3-(L4)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptides, their complexes and mixtures are used to treat infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as agricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides have few if any toxic effects, and those that include D-aa will have increased resistance to proteolytic degradation. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, resistance
                                                                                                                                                                                                         Claim 39; Page 401; 608pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69441 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC copies of this sequence to peptide 26 (see AAW35152). The peptides of CC the invention have: (a) cytolytic activity on pathogenic cells (pathogens CC and malignant cells not naturally present in the body); but (b) no CC haemolytic activity, or such activity only at a concentration CC significantly higher than that at which they lyse pathogens. The CC peptides, their complexes and mixtures are used to treat infections CC (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, CC in human and veterinary medicine. Also, they can be used as preservatives CC for food, cosmetics and agricultural produce, or as agricultural periodice, or the absence of haemolytic activity (associated with CC disturbance of alpha-helical structures) means that the peptides have few if any toxic effects, and those that include D-ra will have increased CC resistance to proteolytic degradation. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Since these crandom copolymers induce total lysis of bacterial cell walls, resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Qy
(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each clindependently selected from -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4.

(L1)c-P1-(L2)d-P2-(L3)e-P3-(D3)e-P3-(D3)e-P3-(L4)f-P4.

(C) where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently composition can be used for producing pharmaceutical compositions. The composition can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombols, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein Abinding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a Leu/Lys diastereomer peptide of the invention. The peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogens and malignant cells not naturally present in the body; but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse pathogens. The peptides, their complexes and mixtures are used to treat infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as agricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides have few if any toxic effects, and those that include D-aa will have increased treatment to the content of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            increased resistance to proteolytic degradation. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectru activity, allowing selection of agents for particular applications. these random copolymers induce total lysis of bacterial cell walls, resistance to them is unlikely to develop.
                                                                                                     Misc-difference
                                                                                                                                         Misc-difference
                                                                                                                                                                                  Misc-difference

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a Leu/Lys diastereomer peptide of the invention. The peptides of the invention have: (a) cytolytic activity on the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse can be peptides, their complexes and mixtures are used to treat infections (caused by bacteria, fungl, protozoa, mycoplasma or viruses) cor cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as capricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides capricated resistance to proteolytic degradation. Non-haemolytic, correased resistance to proteolytic degradation. Non-haemolytic, corresistance to proteolytic degradation as specific spectrum of correct random copolymers of pardaxin, each has a specific spectrum of cactivity, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, very constant cell walls, and the period corresistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                            Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC The present peptide is used to produce the agents of the invention. The CC specification describes a non-haemolytic cytolytic agent, which is a CC peptide, a complex of bundled peptides, a mixture of peptides or a random CC peptide copolymer. The agent has a selective cytolytic activity on CC pathogenic cells. The agent is selected from a cyclic derivative of a CC peptide which has a net positive charge greater than 1, comprises L-amino CC acid residues and/or D-amino acid residues and comprises an alpha-helix CC (comprises L-amino acid residues and D-amino acid residues, has a net CC positive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues CC is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, CC including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used in both human and veterinary medicine.
                                                                                                                                                                                                                                                                                                                                                                                                                                AAW82850

The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino peptide which has a net positive charge greater than 1, comprises L-amino
           New non-haemolytic cytolytic agent useful in treating cancer or infections - is a peptide comprising a moiety which disrupts th continuity of an alpha-helical structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           acid residues and/or D-amino acid residues and comprises an alpha-helix breaker moiety, or a peptide (or cyclic derivative of this) which (comprises L-amino acid residues and D-amino acid residues, has a net
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New non-haemolytic cytolytic agent useful in treating cancer infections - is a peptide comprising a moiety which disrupts continuity of an alpha-helical structure

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc specification describes a non-haemolytic cytolytic agent, which is a competite copolymer. The agent has a selective cytolytic agent which is a cc peptide copolymer. The agent has a selective cytolytic activity on cp peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix cc comprises L-amino acid residues and comprises an alpha-helix cc (comprises L-amino acid residues and comprises an alpha-helix cc (comprises L-amino acid residues and D-amino acid residues, has a net cc positive charge greater than 1 and has an amino acid sequence such that cc positive charge greater than 1 and has an amino acid sequence such that cc is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, cc including bacterial, fungal, viral, mycoplasma and protozoan infections. Cc used as disinfectants for destruction of microorganisms, i.e. in the column of the comprision of the comprision of the columns in the columns are presented to the columns and the columns in the columns are presented to the columns and the columns and the columns are the columns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

Claim 39; Page 379; 608pp; English

```
The present invention describes composition of matter (I) comprising an CC (X1)a-FI-(X2)b, where: FI = an FC domain; X1 and X2 = are each CC (X1)a-FI-(X2)b, where: FI = an FC domain; X1 and X2 = are each CC independently selected from -(L1)c-P1 -(L1)c-P1-(L2)d-P2 (L3)e-P3-(L4)f-P4 (CC vhere P1 - P2 P3 and P4 = are each independently sequences of CC pharmacologically active peptides; L1, L2, L3, and L4 = are each independently condensed that at least 1 of a and b is 1. The composition can CC have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can CC be useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer CC half-life or incorporate functions such as Fc receptor binding, complement fixation, and possibly placental transfer. AAA69443 CC sequences used in the exemplification of the present invention acid con aAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid con sequences used in the exemplification of the present invention.
